EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Daniel Ratoff on 3/25/2008.

The amendment is as follows:

Claim 22 (Currently Amended): An image sensor controller that controls an image sensor having a light receiving section and a transfer section receiving data signals from the light receiving section, the image sensor controller comprising: a drive controller configured to supply a shift/transfer clock to the transfer section, the shift/transfer clock being used for shifting the data signals and transferring the data signals, the shift/transfer clock being configured to have a first frequency during a first period in which a first data signal of the data signals is outputted from a first pixel of a plurality of pixels included in the light receiving section, wherein the first pixel is light-shielded, the shift/transfer clock being configured to have a second frequency during a second period in which a second data signal of the data signals is outputted from a second pixel of the plurality of pixels, and the shift/transfer clock being configured to have a third frequency during a third period in which a third data signal of the data signals is outputted from a third pixel of the plurality of pixels, the first data signal being outputted before the second data signal,

the second data signal being outputted before the third data signal, the first frequency being higher than the second frequency, ~~and~~ the second frequency being higher than the third frequency[.], the first pixel being a dummy pixel, the second pixel being a non-reading pixel, and the third pixel being a reading pixel.

Claim 23: (cancelled)

Claim 24 (Currently Amended): An image sensor controller that controls an image sensor having a light receiving section and a transfer section receiving data signals from the light receiving section, the image sensor controller comprising: a drive controller configured to supply a shift/transfer clock to the transfer section, the shift/transfer clock being used for shifting the data signals and transferring the data signals; the shift/transfer clock being configured to have a first frequency during a first period in which a first data signal of the data signals is outputted from a first pixel of a plurality of pixels that are arranged in one line of the light receiving section, wherein the first pixel is light-shielded; the shift/transfer clock being configured to have a second frequency during a second period in which a second data signal of the data signals is outputted from a second pixel of the plurality of pixels; the shift/transfer clock being configured to have a third frequency during a third period in which a third data signal of the data signals is outputted from a third pixel of the plurality of pixels; the first data signal being outputted before the second data signal; the second data signal being outputted before the third data signal; the first frequency being higher than the second frequency; ~~and~~ the second frequency being higher than the third

frequency[[.]], the first pixel being a dummy pixel; the second pixel being a non-reading pixel; and the third pixel being a reading pixel.

25. (Currently Amended) An image sensor controller that controls an image sensor, the image sensor controller comprising: a drive controller configured to supply a transfer clock and a shift signal to the image sensor, the transfer clock being used for transferring the data signals; the transfer clock being configured to have a first frequency during a first period in which a first data signal of the data signals outputted from a first pixel of a plurality of pixels included in the light receiving section is transferred, wherein the first pixel is light-shielded; the transfer clock being configured to have a second frequency during a second period in which a second data signal of the data signals outputted from a second pixel of the plurality of pixels is transferred; the transfer clock being configured to have a third frequency during a third period in which a third data signal of the data signals outputted from a third pixel of the plurality of pixels is transferred; the first frequency being higher than the second frequency; the second frequency being higher than the third frequency; the first data signal being transferred before the second data signal; the second data signal being transferred before the third data signal, the first pixel being a dummy pixel; the second pixel being a non-reading pixel; and the third pixel being a reading pixel; the first data signal, the second data signal, and the third data signal being transferred during at least a part of a fourth period between a first pulse of a shift signal to a second pulse next to the first pulse of the shift signal.

Claim 26: (cancelled)

Claim 27 (Currently Amended): An image sensor controller that controls an image sensor, the image sensor controller comprising: a drive controller configured to supply a transfer clock and a shift signal to the image sensor, the transfer clock being used for transferring the data signals; the transfer clock being configured to have a first frequency during a first period in which a first data signal of the data signals outputted from a first pixel of a plurality of pixels included in the light receiving section is transferred, wherein the first pixel is light-shielded; the transfer clock being configured to have a second frequency during a second period in which a second data signal of the data signals outputted from a second pixel of the plurality of pixels is transferred; the transfer clock being configured to have a third frequency during a third period in which a third data signal of the data signals outputted from a third pixel of the plurality of pixels is transferred; the first frequency being higher than the second frequency; the second frequency being higher than the third frequency; the first data signal being transferred before the second data signal; the second data signal being transferred before the third data signal, the first pixel being a dummy pixel; the second pixel being a non-reading pixel; and the third pixel being a reading pixel; the first data signal, the second data signal, and the third data signal being transferred during at least a part of a fourth period between a first timing that a shift signal changes from a first level to a second level and a second timing that a shift signal changes from the first level to the second level next to the first timing.

Allowable Subject Matter

1. Claims 3,6-10,12,13,16,19-22,24,25 and 27 are allowed.

The following is an examiner's statement of reasons for allowance: As to the independent claims, The prior art of record does not teach or suggest an image sensor controller that controls an image sensor, the image sensor controller comprising: a drive controller configured to supply a transfer clock and a shift signal to the image sensor for transferring pixels from a dummy pixel region at a first frequency, a transfer clock and a shift signal to the image sensor for transferring pixels from a non-reading pixel region at a second frequency and a transfer clock and a shift signal to the image sensor for transferring pixels from a reading pixel region at a third frequency, wherein the first frequency is higher than the second frequency and the second frequency is higher than the third frequency.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
